

Sustainable Site Selection: The Convergence of Data Center Site Selection and Sustainability

December 31, 2013

The process of data center site selection is being adapted to face the realities of new economic mega forces in areas of policy, design and resources, all of which have critical impact to the long-term sustainability of data center facilities. Site selection is evolving into a complex roadmap of new risks - both current and future - that must be analyzed to manage the collision course of data center operations and sustainability.
