# Week in Review

The modern workplace this week brought us stories of disability fraud, job recruitment with video games, apps to fight procrastination, and distracted driving. Who says work is boring?

In North Carolina, a postal worker was indicted for disability fraud when her appearance on a nationally-televised game show revealed her lifting and grabbing capabilities. She had been collecting workers compensation checks since 2004 for an injury that supposedly prevented her from lifting and grabbing, among other things. In the wired workplace, both employers and employees are finding new uses for technology. Some employers have begun using a video-game style recruitment process called ConnectCube. This application tests, stores, and analyzes user data measuring various job skills, such as memory, spatial skills, and verbal reasoning, then connects high-scoring employees with employers looking for those skills. Employees are using new apps at work to fight the age-old problem of procrastination. But whether you are an employer or an employee, a new study released this week shows that you should scale back your use of technology (even hands-free versions) while driving.
